Postmortem: EU API outage on Oct 7

Draft v2 · Owner: Tobias Brandt · Status: Draft

Summary

Between 07:41 and 08:29 UTC the EU API returned 503 for roughly 38% of requests. A Cloud SQL proxy sidecar started after the application container; the readiness probe kept failing and the automatic rollback only covered the first region.

Timeline (UTC)

07:41	r-2026-10-08-0741 rolls out to europe-west3
07:44	Automatic rollback in europe-west3 finishes
07:47	europe-west1 picks up the release from the second wave
08:02	On-call paged
08:29	Manual rollback in europe-west1, error rate back to baseline

Root cause

The rollout controller halts all waves only for rollbacks it initiated itself. The platform-triggered rollback in europe-west3 looked like a new revision, so the rollout continued.

Action items

Item	Owner
Startup probe for the SQL proxy	Sofia
Halt all waves on any revision change	Daniel
Faster burn-rate alert (1m window)	Mara
Written RCA for SLA customers	Felix, Emma
